

Viva Cannabis

Cultivation Management Overview:

We are a tier 3 cannabis processor out of Wenatchee, Washington. We work exclusively with responsible producers, growing using sustainable methods, best practices, organic nutrients and pesticide management plans.

Mission: Source and sell the highest quality, pesticide free, sun grown product and derived concentrates with a focus on high terpenoid and cannabinoid content.

Our Partner Farms oversight use only OMRI Listed (e.g. organic) products and includes the following:

Growing Medium and helpful treatments – our farmers grow in native soil. In the beginning of each season the farmer test the native soil for nutrient availability and biological populations, in accordance with the test results; add Certified Organic Compost to rich the soil and beneficial microorganisms to enrich the biological activity. That in turn, is meant to provide plants greater access to resources available in the soil and uptake rates i.e. present minerals, nutrients, moisture, which ultimately results in greater plant health.

Spraying Routine – There is a strict no-spray policy 3 weeks before the plant is starting to flip into the flowering stage (during the flowering time the plants only get fresh water). The farmers spray the plants only in the Veg stage:

Beneficial Insects – Predator Mites we ship in if necessary. Lady bugs are natural to our farms.

GRANDEVO – OMRI Listed - Microbe-derived pesticide: Grandevo contains several active compounds that repel, stop feeding, reduce reproduction and induce mortality to prevent the development of damaging populations of sucking and chewing insects, flies and mites. It is used on a wide range of organic crops, including fruits, vegetables, nuts, turf and ornamentals.

VENERATE™ XC – OMRI Listed - Microbe-derived pesticide: powered by several active compounds that span different chemical classes. These compounds drive multiple modes of action which result in exoskeleton degradation and molting interference; control of the pests is achieved through exposure and ingestion of the product. With Venerate's multiple active compounds and modes of action the risk of insect resistance is greatly reduced.

Nutrient Regimen– in accordance with soil test and leaf test results (see above), and only during veg stage, farmers add only missing components in form of mineral N-P-K and Micro-Elements. During the flowering time, the plant gets only fresh water.

Ongoing Soil and Plant Testing – The related producers are performing soil and leaf testing every 3-4 weeks to indicate soil nutrient availability and plant nutrient absorption.

Third Party Material – All cannabis material purchased from third party sources for processing is pesticide and heavy metal tested by Praxis and Confidence Analytics to insure safety and cleanliness.

Product testing: Quality Assurance – All of our finished goods/products are tested in accordance with LCB requirements and submitted to Praxis and Confidence Analytics for full cannabinoid, terpene and pesticide testing prior to their distribution to retailers.

Viva`s mission is focused on sourcing and distributing sustainably-grown, clean, safe and high quality products.
